## PC-/SystemArchitect Version 7.4

The new version of the PC-/SystemArchitect **also supports the MS Vista operating system and MS Office 2007.**

The main changes are:

- Division of the directories into programs "... \Program Files\PC\_CONF\.." and the user data area "..\Profiles\All Users\Application Data\PC\_CONF\.."
- Adaptation of "automatic update" in compliance with the MS Vista security guidelines
- Adaptation of the registry structure
- Setup for the complete version in Microsoft MSI format

The new update version can be used for all PC-/SystemArchitect versions as of release 7.0. This automatically changes the directory structure and copies the files in the directories "Configurations" and "Database". The old directories are then renamed to "Configurations-Backup" and "Database-Backup". The shared target directory for user data is \Profiles\All Users\Application Data\PC\_CONF\.."

Affected directories are:

- Configurations: user configurations
- Database: PC-/SystemArchitect databases
- DestSar2Ask: target directory for ASK converter
- DestSar2Sal: target directory for XML converter
- MapFiles: is used internally by the PC-/SystemArchitect

As a result, all users who have stored their data under "... \Program Files\PC\_CONF\.." should check it and if necessary move it to the new user directory.

The next update versions will only support installations as of release 7.4.

**Support for PC-/SystemArchitect under MS Windows 2000 will be discontinued in March 2008.**

You can also obtain information on the new functions under "Link to [Inform](#)" or under <http://configurator.fujitsu-siemens.com/public/information/>.
